Definition: Analog and digital communications are the two types of data transmission system however several factors generate the difference between the two. The major difference between analog and digital communication lies in the signal being transmitted. In analog communication, the message signal is in analog form i.e., continuous time signal.

Difference Between Analog and Digital Communication (With ...

As the signals are digitized, there are many advantages of digital communication over analog communication, such as – The effect of distortion, noise, and interference is much less in digital signals as they are less affected. Digital circuits are more reliable. Digital circuits are easy to design and cheaper than analog circuits.

Definitions of Analog vs. Digital signals An Analog signal is any continuous signal for which the time varying feature (variable) of the signal is a representation of some other time varying quantity, i.e., analogous to another time varying signal. It differs from a digital signal in terms of small fluctuations in the signal which are meaningful.

The signal which represents this condition with an inclined line in the figure, is an Analog Signal. The communication based on analog signals and analog values is called as Analog Communication. Digital Signal. A signal which is discrete in nature or which is non-continuous in form can be termed as a Digital signal. This signal has individual values, denoted separately, which are not based on the previous values, as if they are derived at that particular instant of time.

An analog or digital signal which repeats itself after a specific interval of time is called periodic signal. They are deterministic signals. Eg: sine wave, square wave, sawtooth wave, etc. Aperiodic signal. An analog or digital signal which does not repeats itself after a specific interval of time is called aperiodic signal. They are random signals.
