Pharmacokinetics can be simply described as the study of 'what the body does to the drug' and includes:

- the rate and extent to which drugs are absorbed into the body and distributed to the body tissues.
- the rate and pathways by which drugs are eliminated from the body by metabolism and excretion.
- the relationship between time and plasma drug concentration.

Pharmacodynamics governs the concentration-effect part of the interaction, whereas pharmacokinetics deals with the dose-concentration part (Holford & Sheiner, 1981). The pharmacokinetic processes of absorption, distribution, and elimination determine how rapidly and for how long the drug will appear at the target organ.

These consequences form the basis for understanding the actions and clinical uses of drugs described in almost every chapter of this book. They may be briefly summarized as follows: Receptors largely determine the quantitative relations between dose or concentration of drug and pharmacologic effects.
