Dynamic models are essential for understanding the system dynamics in open-loop (manual mode) or for closed-loop (automatic) control. These models are either derived from data (empirical) or from more fundamental relationships (first principles, physics-based) that rely on knowledge of the process.

Dynamic Model Introduction

Abstract: This dissertation addresses the modeling and control of planar Solid Oxide Fuel Cell (SOFC) power systems, aimed at developing analysis tools and control solutions to enable this promising technology for mobile applications. The main focus of the research is to explore the dynamic characteristics of the SOFC system and to develop control strategies that can ensure efficient steady state and fast and safe transient operations.
