Most modern ECG machines include automated interpretation algorithms. This analysis calculates features such as the PR interval, QT interval, corrected QT (QTc) interval, PR axis, QRS axis, rhythm and more. The results from these automated algorithms are considered "preliminary" until verified and/or modified by expert interpretation.

### Electrocardiography - Wikipedia

At present, the ECG monitoring system, which mainly collects ECG signals, analyzes and diagnoses, has been widely used, and has played a very important role in the prevention and diagnosis of heart diseases. However, this type of ECG monitor can only be used when the patient is static or the patient is under special circumstances.
