Oddo Harkins Rule Of Element

The Oddo-Harkins rule holds that an element with an even atomic number is more abundant than both elements with the adjacently larger and smaller odd atomic numbers. This tendency of the abundance of the chemical elements was first reported by Giuseppe Oddo in 1914 and William Draper Harkins in 1917. Estimated abundances of the chemical elements in the solar system. Hydrogen and helium, atomic numbers are 1 and 2, respectively, are most abundant, from the Big Bang. Next three elements with ...

Oddo—Harkins rule Rule stating that the cosmic abundance of elements with an even atomic number is greater than that of adjacent elements with an odd atomic number. Consequently, a graph plotting relative atomic abundance against increasing atomic number (Z) displays a 'toothed' curve, rather than a smooth line.

Oddo-Harkins rule describes about the undulatory behavior of even-odd mass elements in universe, even mass elements are most abundant. What are the possible reasons for this unique selection?

Why does the universe like more even mass element than Odd?

Geochemically, therefore, they are lithophile refractory elements. Given that the chemical behavior of the REE is so similar, their abundance patterns in geological materials illustrate well the Oddo-Harkins Rule, i.e., the abundance of Z- odd elements is smaller than the abundance of neighboring Z-even elements.

The two general trends in the remaining stellar-produced elements are: (1) an alternation of abundance in elements as they have even or odd atomic numbers (the Oddo-Harkins rule), and (2) a general decrease in abundance as elements become heavier.

Chemical element Facts for Kids

The Oddo-Harkins rule simply states that the abundance of elements with an even atomic number is greater than the abundance of elements with an odd atomic number. In order to obtain these elements, the minerals must go through a separating process, known as separation chemistry. This can be done with selective reduction or oxidation.

highlights here. Harkins (1917) discovered that elements with even atomic numbers are more abundant than those with odd atomic numbers. This Oddo-Harkins rule is best exemplified for the rare earth elements (REE). During the 1920s and 1930s, Victor Moritz Goldschmidt and his colleagues in Göttingen,
